

# 2014-10-02 OHIE-FR Meeting

**When:** 10/02/2014 at 11:00 AM EDT

**Where:** Google Hangout

**Participants:** Larry, Roger, Knut, Niamh, Scott

**Recorded Video:**

**Agenda:**

- Identifying a first workflow and moving forward on drafting it together.
- Updates on the Facility Registry Implementer Call Moving Forward
- AOB as time allows (Some potential things include: Implementation updates, implementers guide, facility data to support the Ebola outbreak response, and whatever your burning issues are.)

**Outcomes:**

Goal for the Workflow #1:

- User Stories: In TZ, There were many code sets managing different lists. Understanding core data elements and how they can improve roles and responsibilities.
  - Roger/Niamh: See some definition between a TS and code sets used in a FR? Push most in TS except many the hierarchical service may not be well capable. The initial limitation was -> Hierarchy operations and moving branches of trees that terminology servers are set up to do. Also, we haven't addressed the issue of multiple hierarchies ... ( not sure if a TS could prevent data challenges)
    - User story: As a government user I want to redefine admin hierarchy level, as my country evolves, and have that reflected in my tools, to
    - User Story: Multiple hierarchies need to be managed,
  - Knut
    - Resonates well... often see that is a mess in most countries
    - There is no agreed to coding
      - User Story: Some actor(s) in a country is responsible for codeset/standards, I have no source of truth to manage code sets important to FRs
    - Especially a problem in countries where the script is not like english
      - User Story: Users localization and internationalization across languages and scripts
        - Code sets
        - Facilities
        - Tools??
    - WHO - SARA (Service Availability and Readiness Assessment)
      - Standard ones up on a TS
      - Can we help to take this and put it up as an input to requirements gathering that a country does.
      - Can we also use it in the context of supporting countries to define their requirements and where their overlaps is aligned with requirements
    - Map code sets
      - Between standards or between languages
  - Niamh
    - Integrating with DHIS and they have 1 way to categorize ownership and if that can be harmonized . If it is run by the
  - Larry
    - CSD -> Facility X ... what are the services. Which providers are at that facility
    - This work flow could benefit: There would be a standardized way to define what services are there ... instead of a hodgepodge of codings defined by the country. CSD Workflow?
- Roger
- Granularity of services: Is there a single list that everyone users? HIV services that are offered --- there is a standard list used in the US
  - Certified ... for types of services ... required for
  - Implementation question as there are different levels of details and uses.
- Larry
    - Some of the other communities are saying that things have to go through the IL to get to the TS???

Developers vs. Architects vs. Project Managers vs.

- A challenge in TZ ... Not too enthusiastic about western led initiatives
- HISP: Doesn't do a lot of calls, relies on workshops and mailing list
  - Maybe a Conference Line
