2014-10-16 OHIE-FR Meeting

When: 10/16/2014 at 11:00 AM EDT

Where: Google Hangout

Participants:

Recorded Video:

Agenda:

- Workflow for Code sets to be uploaded to a FR: Clarifying any remaining requirements and beginning to determine the specifications/transactions /components needed...
- Identify ways this community can support the Ebola response via Facility Registries or improving facility data availability. I would propose we start by identifying any current needs and see what next steps we might be able to identify.
- AOB / Implementation Updates as of interest

Outcomes:

Workflow - Codeset Sharing User Stories

- User story: As a government user I want to redefine admin hierarchy level, as my country evolves, and have that reflected in my tools, to
- User Story: Multiple hierarchies need to be managed,
- User Story: Some actor(s) in a country is responsible for codeset/standards, I have no source of truth to manage code sets important to FRs
- User Stories: In TZ, There were many code sets managing different lists. Understanding core data elements and how they can improve roles and responsibilities
- User Story: Users localization and internationalization across languages and scripts
    - Code sets
    - Facilities
    - Tools??
- User Stories: I need to help manage hierarchical and flat

Questions….

Q1: Any proven existing methods for doing this?

- Sweden … Might be a good (http://www.geonames.org/NO/administrative-division-norway.html) & (http://en.wikipedia.org/wiki/ISO_3166-2)
- Native API - From Apelon … I wonder what specification
    - Struggles to handle hierarchical code sets
    - FR might be a good place to hold this
    - Being sorta used by OpenHIE
- DHIS solution in the future on the roadmap

Q1.1: What should be the source of truth?

- SA as an example with DHIS
- Location Registry similar to bangladesh
- Could a Facility Registry be the source (Use a Rest Interface?)
- Should be TS?

Q1.2: Does the hierarchy include the facility and sub-levels,

Q2: How should we engage with the TS community?

- Go to their call
- Define a hierarchy fields
- Would it be possible to have a short list of things to keep?
    - Administrative Hierarchy (MOH / PMORALG)
    - Other partner hierarchies … (Census Group/NIMR)
    - ICD-10?
    - ICHI might be an option in the future … or DHIS ICD-10 code…

Q3: Is there a need for consumers of the FR to better understand the metadata?

- https://github.com/facilityregistry/fred-api/issues/57

Q4: Any ideas on standards to consider? (FHIR, otherwise?)

Q5: How would the FR tool incorporate it into a data structure

- You wouldnt want to automatically display the new
- You may want to track changes
- Need some way to show new and old context …
