

Implemented Entry Templates

Unlike sections, entries are only imported when OpenSHR has a registered handler for a particular entry type. Entries which carry unknown template identifiers result in an exception being thrown on import if and only if the entry is contained within a registered level 3 section handler.

Example: If an Advance Directive section is recognized by OpenSHR however an entry within that Advance Directive section is identified with a template identifier for which there are no handlers then the import will fail.

Outlines the CDA entries currently supported in OpenSHR.
